DeflationaryDBTC (DBTC) – Tokenomics v2.1

DeflationaryDBTC (DBTC) is a deflationary ERC-20 token deployed on Polygon PoS, designed with a fixed maximum supply and an immutable supply-reduction model enforced at the smart contract level.

Maximum Supply: 2,000,000,000 DBTC
Current Effective Supply: 1,400,000,000 DBTC
Target Long-Term Supply: 21,000,000 DBTC

Burn Mechanism: A total of 600,000,000 DBTC have already been permanently removed from circulation. An additional 500,000,000 DBTC are reserved for final team-committed burn events.

DAO Reserve (Q1 & Q2): Q1 and Q2 allocations are reserved for DAO governance and designated exclusively for potential burn decisions. These tokens are non-circulating.

Liquidity Allocation: 700,000,000 DBTC are allocated to decentralized exchange liquidity pools to support open-market trading.

Team Allocation: 90,000,000 DBTC are allocated to the core development team.

Airdrop & Community Incentives: 20,000,000 DBTC allocated for ecosystem growth.

Non-Circulating Supply Notice: Tokens held at the contract level without exposed transfer or burn functions are permanently excluded from circulation.
